

Reflection

referencing internal and external resources

I had difficulty understanding the correct link between relative and absolute paths. Some links didn't work because I mistakenly referenced files in different folders. However, I checked each link on the Chrome browser. By testing, I figured out where I needed to adjust them. I learned that HTML relies on the correct file structure to link resources like folders and CSS. If the folder setup isn't right or the paths are wrong, the file won't load. The most challenging part was understanding when to use relative and absolute paths. I overcome this by practicing with different file structures and testing each link step by step.
